This three-volume work is a must for the bookshelf of anyone interested in Old English magic, medicine, folklore, and heathen practice. Published in 1864-6, it was put together and edited by Thomas Oswald Cockayne (1807-73), a Cambridge graduate, much-published early member of the London Philological Society, and teacher of the philologists Walter Skeat and Henry Sweet. It is a collection of writings and lore from Anglo-Saxon England on plants, medicine and the heavens, mostly in Old English with accompanying modern English translations. Volume 1 begins with a substantial preface outlining the Anglo-Saxon reception of Greek and Latin medical texts. The main work in this volume is an Old English version of the late Latin Herbarium formerly attributed to Apuleius, augmented by material deriving from Dioscorides' De Materia Medica. The volume concludes with an Old English translation of the fourth-century Roman physician Sextus Placitus'

writings on animal-derived medicines, and some short medicinal recipes in Old English and Latin taken from the fly leaves of manuscripts. In this new reproduction of the original work, the announcements and advertisements of the original publisher, having nothing essential to do with the work, have been removed. This does not affect the original page-numbering.

Edmund Leach's book investigates the writings of 'structuralists,' and their different theories: the general incest theory and of animal sacrifice. This book is designed for the use of teaching undergraduates in anthropology, linguistics, literary studies, philosophy and related disciplines faced with structuralist argument. It provides the prolegomena necessary to understand the final chapter of Levi-Strauss's massive four-volume *Mythologiques*. Some prior knowledge of anthropological literature is useful but not essential. The principal ethnographic source is the Book of Leviticus; this guide should help anyone who is trying to grasp the essentials of 'seminology' - the general theory of how signs and symbols come to convey meaning. The author's core thesis is that: 'the indices in non-verbal communication systems, like the sound elements in spoken language, do not have meaning as isolates, but only as members of set'; the book's special merit is that it makes this kind of jargon comprehensible in terms of our everyday experience.

For the first time, a synthesis on the research work done in Europe on all Bark And Wood Boring Insects In Living Trees (BAWBILT) is presented. As final product of a four-year research project gathering together 100 scientists from 24 countries, the book is the fruit of a real collective synthesis in which all European specialists have participated. It reviews and comments on all the European literature, while considering the biological (trees, insects, associated organisms, and their relationships) and forest management aspects. However, although focused on the European forest, it also compares the available information and interpretations to those concerning similar species in other continents. It ends with propositions of research priorities for Europe. The book is directed to all scientists and students concerned with forest entomology and ecology, as well as to forest managers and all scientific public interested in forest biology.

In *Learning with Information Systems* the author takes the developing world as the context and through a series of case studies develops a commonly used systems analysis methodology. He demonstrates how this methodology can evolve and adapt as new ideas become prominent. Issues of sustainability of information systems, participation in systems design and user ownership of systems are all examined. This book does not attempt to be prescriptive for all contexts nor does it focus on any particular technology. It addresses the essential questions and promises practical approaches which will help in the avoidance of the worst forms of disaster associated with the planning of information systems for developing countries.

The Chosen Primate ends by looking forward to the next millennium, noting that our future depends on our response to another fundamental question: Will our culture, which has given us the means to adapt successfully to nature, ultimately destroy nature? In raising this question, Kuper shows that debates in anthropology are more than just academic disputes - they engage the major issues of our time.

Violence is one of the most important challenges, not only for public health systems, but also for public mental health. Violence can have immediate as well as long-term and even transgenerational effects on the mental health of its victims. This book provides a comprehensive and wide-ranging assessment of the mental health legacy left by violence. It addresses the issues as they affect states, communities and families, in other words at macro-, meso- and microlevels, beginning by describing the impact of violence on neurobiology and mental health, as well as the spectrum of syndromes and disorders associated with different forms of violence. The work moves on to tackle violence at the international—and intranational—level before zeroing in on the nature of violence in communities such as villages or city districts. It also examines the results of violence in the family. Each type of violence has distinct effects on mental health and in each chapter specific groups are explored in depth to demonstrate the heterogeneity of violence as well as the diversity of its outcomes in the realm of public mental health. Finally, the book addresses the notion of 'undoing violence' by detailing case studies of effective interventions and prevention occurring in countries, communities and families. These cases give us pause to reflect on the nature of resilience and dignity in the context of violence and mental health. All the chapters have been written by leading authors in the field and provide a state-of-the-art perspective. The authors, from different fields of expertise, facilitate interdisciplinary and international insights into the impact of violence on mental health.
