"Microbiology covers the scope and sequence requirements for a single-semester microbiology course for non-majors. The book presents the core concepts of microbiology with a focus on applications for careers in allied health. The pedagogical features of the text make the material interesting and accessible while maintaining the career-application focus and scientific rigor inherent in the subject matter. Microbiology's art program enhances students' understanding of concepts through clear and effective illustrations, diagrams, and photographs. Microbiology is produced through a collaborative publishing agreement between OpenStax and the American Society for Microbiology Press. The book aligns with the curriculum guidelines of the American Society for Microbiology."--BC Campus website.

The National Council of Teachers of Mathematics gave us important guidance on developing a coherent curriculum with key focal points for each grade level, Jane F. Schielack and Dinah Chancellor give us the practical strategies for implementing the focal points in our instruction. Janie and Dinah understand that teaching a focused curriculum takes special planing efforts. Each lesson has to be designed with an eye for teaching concepts nad skills, and for building purposeful connections. With their lesson template and suggestions for long-term planning they simplify the process and make it manageable. They address a range of strategies that math leaders nad teachers can use for instructional design that helps students achieve deeper understanding by: prioritizing and combining mathematical ideas within tasks, making thoughtful selections of instructional tools, building relevance for mathematics, managing classroom

conversations, building connections among multiple representations, allowing appropriate time for learning, using assessment effectively, and differentiating instruction.

The fundamental mathematical tools needed to understand machine learning include linear algebra, analytic geometry, matrix decompositions, vector calculus, optimization, probability and statistics. These topics are traditionally taught in disparate courses, making it hard for data science or computer science students, or professionals, to efficiently learn the mathematics.

This self-contained textbook bridges the gap between mathematical and machine learning texts, introducing the mathematical concepts with a minimum of prerequisites. It uses these concepts to derive four central machine learning methods: linear regression, principal component analysis, Gaussian mixture models and support vector machines. For students and others with a mathematical background, these derivations provide a starting point to machine learning texts. For those learning the mathematics for the first time, the methods help build intuition and practical experience with applying mathematical concepts. Every chapter includes worked examples and exercises to test understanding. Programming tutorials are offered on the book's web site.

This book is about making machine learning models and their

decisions interpretable. After exploring the concepts of interpretability, you will learn about simple, interpretable models such as decision trees, decision rules and linear regression. Later chapters focus on general model-agnostic methods for interpreting black box models like feature importance and accumulated local effects and explaining individual predictions with Shapley values and LIME. All interpretation methods are explained in depth and discussed critically. How do they work under the hood? What are their strengths and weaknesses? How can their outputs be interpreted? This book will enable you to select and correctly apply the interpretation method that is most suitable for your machine learning project.
