The first encyclopedia in the field, the International Encyclopedia of Ergonomics and Human Factors provides a comprehensive and authoritative compendium of current knowledge on ergonomics and human factors. It gives specific information on concepts and tools unique to ergonomics. About 500 entries, published in three volumes and on CD-ROM, are pre

Handbook of Electrical Installation Practice covers all key aspects of industrial, commercial and domestic installations and draws on the expertise of a wide range of industrial experts. Chapters are devoted to topics such as wiring cables, mains and submains

cables and distribution in buildings, as well as power supplies, transformers, switchgear, and electricity on construction sites. Standards and codes of practice, as well as safety, are also included. Since the Third Edition was published, there have been many developments in technology and standards. The revolution in electronic microtechnology has made it possible to introduce more complex technologies in protective equipment and control systems, and these have been addressed in the new edition. Developments in lighting design continue, and extra-low voltage luminaries for display and feature illumination are now dealt with, as is the important subject of security lighting. All chapters have been amended to take account of revisions to British and other standards, following the trend to harmonised European and international standards, and they also take account of the latest edition of the Wiring Regulations. This new edition will provide an invaluable reference for consulting engineers, electrical contractors and factory plant engineers.

Health and Safety: Risk Management is the clearest and most comprehensive book on risk management available today. This newly revised fourth edition integrates new developments in legislation, standards and practice, and incorporates up-to-date information for qualification syllabuses. The book is divided into four main parts. Part 1.1 is primarily concerned with the fundamentals of risk management and is relevant for all students

of health and safety, while Part 1.2 covers the required basic human factors material required for health and safety qualifications. Part 2.1 deals with the more advanced aspects of risk management, while Part 2.2 covers the more advanced human factors material required by those studying for qualifications in health and safety. This authoritative treatment of risk management is essential reading for both students working towards degrees, diplomas and postgraduate or vocational qualifications in health and safety and experienced health and safety professionals, who will find it invaluable as a reference.

**Loss Prevention in the Process Industries** Guyer Partners Proceedings of a conference organized in co-operation with the Commission of the European Communities and OECD/NEA, Tokyo, 15-19 February 1988. The conference demonstrated that the development of computer technologies offered great potential in the design of future control rooms for nuclear power plants with enhanced information processing capabilities.

Achieving Nuclear Safety Springer Science & Business Media Electrical Systems and Equipment is the work of some 50 electrical design specialists in the power engineering field based largely on the work and experience of GDCD's (Generation Development and Constructor Division of the CEGB) Electrical Branch. The volume describes the design philosophies and techniques of power engineering, the solutions to the large number of design problems encountered and the plant which has been chosen and developed to equip electrical systems both within the different types of new power station, and modification tasks at existing stations.

The Halden Man-Machine Laboratory (HAMMLAB) has been at the heart of human factors research at the OECD Halden Reactor Project (HRP). The HRP is sponsored by a group of national organizations, representing nuclear power plant regulators, utilities, and research institutions. The HRP is hosted by the Institute for Energy Technology (IFE) in Halden, Norway. HAMMLAB comprises three full-scale nuclear power plant control room research simulators. The simulator studies performed in HAMMLAB have traditionally been experimental in nature. In a simulator it is possible to study events as they unfold in real time, in a highly realistic operational environment under partially controlled conditions. This means that a wide range of human factors issues, which would be impossible or highly impracticable to study in real-life settings, can thus be addressed in HAMMLAB. Simulator-based Human Factors Studies Across 25 Years celebrates the twenty-fifth anniversary of HAMMLAB by reviewing the human factors studies performed in HAMMLAB across this time-span. A range of human factors issues have been addressed, including: • human-system interfaces; • alarm systems; • computerized procedures; • human-automation interaction; • staffing, teamwork and human reliability. The aim of HAMMLAB studies has always been the same: to generate knowledge for solving current and future challenges in nuclear power plant operation to contribute to safety. The outcomes of HAMMLAB studies have been used to support design and assessment of nuclear power plant control rooms.

**International Conference on Electrical and Control Aspects of the Sizewell B PWR** Peter Peregrinus Limited

For executives who do not get their hands dirty and for people in such departments as sales and finance, surveys process instrumentation and explains its principles and uses to make them familiar with the territory but not experts in it. Also usable in technical schools as an elementary introduction. The information is applicable in a wide range of industries. Mentions 1993 for a third printing, presumably of the first edition.
